

CSC 47300 - Web Design Project - Fall 2022

Group Members: Ashraq Khan, Bryan Rivas, Carlos Flores

Description

The project will revolve around making a website similar to an existing site called MyAnimeList. This website allows users to create personalized lists of animes they have watched, and/or plan to watch, as well as providing them with an option to rate such shows. For the purpose of this project, instead of just anime, our project will expand on this idea and also include movies and popular TV shows as well.

In our finalized website, users are allowed to create a list of their favorite media and provide ratings to whatever movie or show they have watched. With an easy-to-follow user interface and different categories of entertainment to choose from, people who visit this website can check to see if particular movies or shows that they want to watch are “worth the hype”.

Relevance and Use

A lot of times, people are faced with a moment of boredom or they are stuck with nothing to do. Some other times, people want to be organized about shows or series they have completed. The goal of this website is to tackle those problems. By incorporating the lists and ranking aspects for a more generalized media, people of all ages will be able to not only keep track of series/movies they have watched and liked, but also help out other people find entertaining media via their rankings.

Possible Tools Utilized

HTML/CSS, JavaScript, Node, PyQt, React, Python, MySQL
